RAG's goal is to provide our customers with safe, efficient and affordable energy and gas storage services. We want to build on our core competency as a technology leader by linking conventional energy forms and renewables.

Our strategy has the following pillars:

1

Increasing energy storage capacity

We want to support the expansion of renewable energy sources by increasing our storage capacity, thereby playing an important part in strengthening security of supply in Austria and Europe.

Development of leading-edge sustainable technologies: "green gas"

The potential of innovations such as "power-to-gas" is to be harnessed to synthesise gas from wind and solar energy.

2

Promoting decentralised, renewable and energy-efficient energy generation and use

Our aim is to exploit all the potential synergies in power generation. These range from gas production, waste heat utilisation and geothermal energy through to the use of gas (LNG/CNG) in the transport sector.

Stronger engagement with customers and stakeholders

We seek to provide our stakeholders with comprehensive information and to engage in open dialogue with them, whilst also transparently involving all concerned in official procedures.

4

Continuous improvement of our health, safety and environmental standards

We are aiming for zero accidents in all of our activities. Our internal health, safety and environment (HSE) management system is regularly evaluated and refined as we work towards this goal. Fulfilment of our aftercare obligations when decommissioning gas production installations protects the immediate surroundings, local residents and our employees.
